Acknowledgements	x
Preface	xi
Introduction	1
Chapter 1 Protective earthing	3
1.1 Protective earthing	3
1.2 Source earthing	3
1.3 The purpose of source earthing	3
1.4 The purpose of electrical equipment earthing	4
Chapter 2 The means of earthing	5
2.1 The means of earthing	5
2.2 Distributors' facilities	5
2.3 Earth electrodes	6
2.4 Rod electrodes	6
2.5 Tape and wire electrodes	8
2.6 Plate electrodes	8
2.7 Structural metalwork electrodes	9
2.8 Metal covering of cables for electrodes	10
2.9 Location of the installation earth electrode	10
2.10 Resistance of the earth electrode	10
2.10.1 Calculating the resistance of a rod electrode	12
2.10.2 Calculating the resistance of a plate electrode	13
2.10.3 Calculating the resistance of a tape electrode	13
2.10.4 Limiting values of the electrode resistance for TT systems	13
2.11 Electrode installation	14
2.12 Electrode loading capacity	15
2.13 Measurement of the electrode resistance	15
2.13.1 Proprietary earth electrode test instrument	15
2.13.2 Earth fault loop impedance test instrument for measuring electrode resistance	17
2.14 Determination of the external earth fault loop impedance, Z_e	18
2.15 Responsibility for providing a means of earthing	19
Chapter 3 The earthing conductor	21
3.1 The earthing conductor	21
3.2 The cross-sectional area of an earthing conductor	22
3.3 The CSA of a buried earthing conductor	23
3.4 Minimum CSA of an earthing conductor	24

3.5	Impedance contribution of an earthing conductor	24
3.6	Colour identification of an earthing conductor	24
3.7	Protection of an earthing conductor against external influences	24
3.8	Disconnection of the earthing conductor	25
3.9	Connection of the earthing conductor to the means of earthing	25

Chapter 4 System types and earthing arrangements **27**

4.1	A system	27
4.2	TN-C system	28
4.3	TN-S system	29
4.4	TN-C-S system	30
4.5	TT system	32
4.6	IT system	34

Chapter 5 Main equipotential bonding **35**

5.1	The purpose of main equipotential bonding	35
5.2	Main equipotential bonding conductors	38
5.2.1	Cross-sectional areas	41
5.2.2	Identification	42
5.2.3	Supports	43
5.2.4	Alterations and extensions	44
5.3	Earth-free equipotential bonding	45
5.4	Bonding of lightning protection systems	46
5.5	Extraneous-conductive-parts common to a number of buildings	47
5.6	Installations serving more than one building	49
5.7	Multi-occupancy premises	52

Chapter 6 Extraneous-conductive-parts and their connections **55**

6.1	Definition of an extraneous-conductive-part	55
6.2	Some examples of extraneous-conductive-parts	57
6.3	An example of a conductive part which is not an extraneous-conductive-part	57
6.4	Connection to pipework	58
6.5	Connections to structural steel and buried steel grids	61

Chapter 7 Automatic disconnection **63**

7.1	Automatic disconnection	63
7.2	TN systems	63
7.2.1	Earth fault loop impedance	65
7.2.2	Mixed disconnection times	69
7.2.3	Automatic disconnection for socket-outlets etc. in 5 s	72
7.2.4	Automatic disconnection using an RCD	73
7.3	TT systems	73
7.4	IT systems	73
7.5	Automatic disconnection for portable equipment for use outdoors	75
7.6	Automatic disconnection for circuits supplying fixed equipment outdoors	75
7.7	RCDs in series	76

7.8	Automatic disconnection for reduced low voltage circuits	77
7.9	Automatic disconnection and alternative supplies	79
7.10	Separated extra-low voltage systems (SELV)	80
7.11	Protective extra-low voltage systems (PELV)	80
7.12	Functional extra-low voltage systems (FELV)	81

Chapter 8 Supplementary equipotential bonding **83**

8.1	Supplementary equipotential bonding	83
8.2	Supplementary bonding conductor types	85
8.3	CSAs of supplementary bonding conductors	86
8.4	Limitations on resistance of supplementary bonding conductors	87
8.5	Supports for supplementary bonding conductors	87
8.6	Bath and shower rooms	88
8.7	Shower cabinet located in a bedroom	91
8.8	Swimming pools	91
8.9	Agricultural and horticultural premises	94
8.10	Restrictive conductive locations	97
8.11	Static inverters	99
8.12	Other locations of increased risk	99
8.13	Where automatic disconnection is not achievable	99

Chapter 9 Circuit protective conductors **101**

9.1	Circuit protective conductors	101
9.2	Cross-sectional areas	102
9.2.1	Calculation of CSA – general case	102
9.2.2	Selection of CSA – general case	103
9.2.3	Non-copper CPCs	104
9.2.4	Evaluation of k	105
9.3	Armouring	106
9.3.1	Calculation of CSA – armoured cable	106
9.3.2	Selection of CSA – armoured cable	106
9.3.3	Contribution to earth fault loop impedance	107
9.3.4	Armouring inadequate for a CPC	107
9.3.5	Termination of armoured cables	107
9.4	Steel conduit	108
9.4.1	Calculation of CSA – steel conduit	109
9.4.2	Selection of CSA – steel conduit	110
9.4.3	Maintaining protective conductor continuity	111
9.5	Steel trunking and ducting	111
9.5.1	Maintaining protective conductor continuity	112
9.6	Metal enclosures	112
9.7	Terminations in accessories	113
9.8	CPC for protective and functional purposes	115
9.9	Significant protective conductor currents	115
9.9.1	Equipment	118
9.9.2	Labelling at distribution boards	118
9.9.3	Ring final circuits	119
9.9.4	Radial final circuits	119
9.9.5	Busbar systems	120
9.9.6	Connection of an item of equipment (protective conductor current exceeding 10 mA)	120

9.9.7	TT systems	122
9.9.8	IT systems	122
9.9.9	RCDs	122
9.10	Earth monitoring	122
9.11	Proving continuity	124
9.11.1	Radial circuits	124
9.11.2	Ring final circuits	127

Chapter 10 Particular issues of earthing and bonding **129**

10.1	Clean earths	129
10.2	PME for caravan parks	130
10.3	Exterior semi-concealed gas meters	131
10.4	Small-scale embedded generators	133
10.4.1	Statutory regulations	133
10.4.2	Engineering Recommendation G83	133
10.4.3	Means of isolation	134
10.4.4	Warning notices	135
10.4.5	Up-to-date information	135
10.4.6	The Stirling engine	136
10.4.7	Guidance Note 7: <i>Special Locations</i>	136
10.5	Mobile and transportable units	136
10.5.1	The term 'mobile or transportable unit'	136
10.5.2	Examples of mobile or transportable units	137
10.5.3	The risks	137
10.5.4	Reduction of risks	137
10.5.5	Supplies	138
10.5.6	TN-C-S with PME	138
10.5.7	Protection against direct contact	139
10.5.8	Protection against indirect contact	139
10.6	Highway power supplies and street-located equipment	139
10.6.1	Street furniture and street-located equipment	139
10.6.2	Street furniture access doors	140
10.6.3	Earthing of street furniture access doors	140
10.6.4	Earthing of Class 1 equipment within street furniture and street-located equipment	140
10.6.5	Distribution circuits	140
10.6.6	Temporary supplies	140
10.7	Suspended ceilings	141
10.8	Exhibitions, shows and stands	143
10.8.1	Protection by automatic disconnection of supply	143
10.8.2	Distribution circuits	143
10.8.3	Installations incorporating a generator	143
10.8.4	Final circuits	144
10.9	Potentially explosive atmospheres	144
10.10	Medical locations	146
10.10.1	TN-C system	146
10.10.2	SELV and PELV	146
10.10.3	Protection against indirect contact	146
10.10.4	TT systems	147
10.10.5	Medical IT systems	147
10.10.6	Transformers for a medical IT system	147
10.10.7	Supplementary equipotential bonding	148

10.11	Marinas	149
10.11.1	The risks	149
10.11.2	Minimising the risks	149
10.11.3	Protection against direct contact	150
10.11.4	Protection against indirect contact	150
10.11.5	Isolating transformers	150
10.12	Cable tray and cable basket	151
10.13	Inspection and testing of protective conductors	153

Appendix A: Values for k for various forms of protective conductor 155

Appendix B: Data for armoured cables 157

Index 161
